Saving Data - Agenda

- **Change Tracking**
- **Asynchronous Commands**
- **Saving Data**
- **Validation**

Why Track Changes?

- Enabling / Disabling of Buttons

- Prevent Navigation

- Make sure the user is done

- KoLite

- ko.dirtyFlag
- <https://nuget.org/packages/KoLite>

Saving Data - Agenda

- Change Tracking
- Asynchronous Commands
- Saving Data
- Validation

Asynchronous Commands

Disabled and Activity

ko.activity

ko.asyncCommand

ko.DirtyFlag

```
PM> Install-Package KoLite
```

KoLite on NuGet

Defining a ko.asyncCommand

1

Define the command

2

The Function to
Execute

3

Save the Data

```
saveCmd = ko.asyncCommand({  
  execute: function(complete) {  
    $.when(datacontext.persons.updateData(speaker()))  
      .always(complete);  
  },  
  canExecute: function(isExecuting) {  
    return !isExecuting && isDirty() && isValid();  
  }  
});
```

4

Define the Conditions When
the User Can Save

Binding a ko.asyncCommand

```
<button data-bind="command: saveCmd, activity: saveCmd.isExecuting">  
  Save</button>
```

The diagram consists of two orange arrows. The first arrow originates from the `saveCmd` property access in the `command` attribute of the button's `data-bind` and points to the `saveCmd` variable assignment in the JavaScript code below. The second arrow originates from the `saveCmd.isExecuting` property access in the `activity` attribute of the button's `data-bind` and points to the `isExecuting` property access within the `canExecute` function in the JavaScript code below.

```
saveCmd = ko.asyncCommand({  
  execute: function(complete) {  
    $.when(datacontext.persons.updateData(speaker()))  
      .always(complete);  
  },  
  canExecute: function(isExecuting) {  
    return !isExecuting && isDirty() && isValid();  
  }  
});
```

Saving Data - Agenda

- Change Tracking
- Asynchronous Commands
- Saving Data
- Validation

Defining Model Validation

Common Rules

```
self.firstName = ko.observable().extend({ required: true });  
  
self.email = ko.observable().extend({ email: true });  
  
self.blog = ko.observable().extend({  
    pattern: {  
        message: 'Not a valid url',  
        params: /[@]([A-Za-z0-9_]{1,15})/i  
    }  
});
```

Built in Validation Rule

Custom Validation Rule

Knockout Validation Plug-In

Define validation on observables

Configure behavior

Check validation errors

```
PM> Install-Package Knockout.Validation
```

<http://nuget.org/packages/Knockout.Validation>

Saving Data - Recap

- **Saving Data**

- datacontext to dataservice to Web API

- **KoLite**

- Change Tracking
 - Asynchronous Commands
 - Command Activity
 - <https://nuget.org/packages/KoLite>

```
PM> Install-Package KoLite
```

- **Validation**

- HTML5 and JavaScript based
 - Knockout.Validation
 - <http://nuget.org/packages/Knockout.Validation>

```
PM> Install-Package Knockout.Validation
```
